ABSTRACT:

Genes encoding a human PLC-.alpha. polypeptide are provided. An expression vector containing these genes and a transformant having the expression vector are provided. The human PLC-.alpha. polypeptide can be produced by cultivating the transformant. The human PLC-.alpha. polypeptide is useful as an anti-inflammatory agent. Furthermore, a measurement system for conducting clinical evaluation of canceration can be constructed by using the PLC-.alpha. polypeptide.

ABSTRACT:

The present invention provides amino acid sequences of peptides that are encoded by genes within the human genome, the phospholipase peptides of the present invention. The present invention specifically provides isolated peptide and nucleic acid molecules, methods of identifying orthologs and paralogs of the phospholipase peptides, and methods of identifying modulators of the phospholipase peptides.

AB The invention provides a gene coding for a <b>human phospholipase C-<math>\alpha</math></b> (PLC- $\alpha$ ), an expression vector containing the gene, and a transformant containing the vector. A human PLC- $\alpha$ is produced by culturing the transformant. The polypeptide is useful as an antiinflammatory and can be used as a parameter for clin. evaluation of canceration.

 AB The invention relates to novel genes for **human phospholipase D** (PLD2), proteins produced by the gene, variants of PLD2, antibodies to the protein, assays using the protein and antibodies, and methods of treating PLD-dependent diseases using the compns. of the invention. Two splice variants of the enzyme are described. Manufacture of the enzyme in prokaryotic and eukaryotic expression systems and methods of purifying it are discussed.

AB The invention provides cDNA sequences of a novel **human phospholipase 11** (11 kDa) cloned from human embryonic brain. The invention also relates to constructing the cloned gene expression vectors to prepare its recombinant protein using *E.coli* cells or eukaryotic cells. Methods of expressing and preparing the above recombinant protein and its antibody are described. Methods of using related gene or protein products for the treatment of various kinds of diseases, such as cancer, blood diseases, HIV infection, immune diseases and inflammation are also disclosed. Methods for screening for related analogs, agonists, inhibitors and antagonists to be used as therapeutic drugs are also described.

AB The invention provides novel polynucleotides and polypeptides encoded by such polynucleotides and mutants or variants thereof that correspond to a novel human secreted phospholipase-like polypeptide. These polynucleotides comprise nucleic acid sequences isolated from cDNA library from human adult kidney (Invitrogen) (Hyseq clone identification number 11061354) and from human mixed tissue (Hyseq identification number 31909463). Other aspects of the invention include vectors containing processes for producing novel human secreted phospholipase-like polypeptides, and antibodies specific for such polypeptides.

AB This invention provides protein and cDNA sequences for a newly identified human protein PLCD5, which is believed to encode a novel member of phospholipase C  $\delta$ 5 family, since it shows homol. with *Rattus norvegicus* phospholipase C  $\delta$ 4. In one embodiment, the invention relates to diagnostic assays for detecting diseases associated with inappropriate PLCD5 sequence homolog activity or levels. Also disclosed are methods for utilizing sequence homolog in drug screening assays and in therapy directed against diseases associated with inappropriate PLCD5 sequence homolog activity or levels.

AB A novel endogenous human phospholipase inhibitor (GIPL) that is similar to the neutralizing factor of *Crotalus* liver and a cDNA encoding it is cloned from a THP-1 cell line cDNA bank. The protein, or a sense or antisense DNA for it, can be of therapeutic use in controlling levels of phospholipase A2 in the treatment of inflammatory disease (no data). Antibodies to the protein also have diagnostic and therapeutic uses and expression systems can be used to screen for agonists or antagonists of the inhibitor (no data). Cloning of the cDNA by homol. searching of sequence databases is described.

AB 5'-Upstream region of the phospholipase C- $\beta$ 2 gene, 810 bp, was cloned and characterized. S1 nuclease mapping and primer extension analyses revealed that a single transcriptional start site locates at 284 nucleotides upstream from the beginning of translation. The 5'-upstream region lacks both TATA motif and typical initiator sequence, but retains GC-rich segment. Two putative regulatory regions, a neg. region (-636/-588) and a pos. region (-98/-13) were identified in the upstream region of PLC- $\beta$ 2 gene. We suggest that the transcription of PLC- $\beta$ 2 may be regulated by binding of regulatory proteins to the neg. and/or pos. regulatory regions located in the upstream of the gene.
